Strings, Structs, malloc, 2D arrays

Jinyang Li

What we have learnt

- Bitwise operations
- Pointers and arrays
- ASCII Characters

Today

- strings
- structs, malloc, 2D array

C Strings

Strings

- String is represented as an array of chars.
 - Array has no space to encode its length.
- How to determine string length?
 - possible solution: explicitly pass an int representing length

```
// tolower_string turns every character in character array s
// into lower case
void tolower_string(char *s, int len) {
    for (int i = 0; i < len; i++) {
        s[i] = tolower(s[i]);
    }
}</pre>
```

Strings

- String is represented as an array of chars.
 - Array has no space to encode its length.
- How to determine string length?
 - Possible solution: explicitly pass an int representing length
 - C string stores a NULL character to mark the end (by convention)

```
void tolower_string(char *s) {
}
```

Strings

- String is represented as an array of chars.
 - Array has no space to encode its length.
- How to determine string length?
 - explicitly pass around an integer representing length
 - C string stores a NULL character to mark the end (by convention)

```
void tolower_string(char *s) {
    int i = 0;
    while (s[i] != '\0') {
        s[i] = tolower(s[i]);
        i++;
    }
}
```

does this make a copy of "hi"?

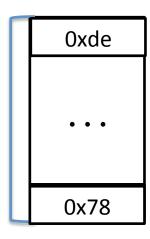

```
char s[3] = {'h', 'i', '\0'};
char *h;
h = s;
h[0] = 'H';
```

printf("s=%s h=%s\n",s,h);

0x00 'i' 'h'

0xdeadbefef12345678

• •

h:

. . .

does this make a copy of "hi"?

```
char s[3] = {'h', 'i', '\0'};
char h[3];
h = s;
h[0] = 'H';

printf("s=%s h=%s\n",s,h);
```

```
void strcpy(char *dst, char *src)
int main()
   char s[3] = \{'h', 'i', '\setminus 0'\};
   char h[3];
   strcpy(h, s);
   h[0] = 'H';
   printf("s=%s h=%s\n",s,h);
```

```
void strcpy(char *dst, char *src) {
    int i = 0;
    while (src[i] != '\0') {
        dst[i] = src[i];
       i++;
                           strcpy is included in C std library.
int main() {
   char s[3] = {'h', 'i', '\setminus 0'};
   char h[3];
   strcpy(h, s);
   h[0] = 'H';
   printf("s=%s h=%s\n",s,h);
}
```

```
void strcpy(char *dst, char *src) {
    int i = 0;
    while (src[i] != '\0') {
        dst[i] = src[i];
        i++;
int main() {
   char s[3] = \{'h', 'i', '\wedge \alpha'\}
                         Results in out-of-bound write!
   char h[2];
                          Buffer overflow!
   strcpy(h, s);
   h[0] = 'H';
   printf("s=%s h=%s\n",s,h);
}
```

```
void strncpy(char *dst, char *src, int n) {
    int i = 0;
    while (src[i] != '\0' && i < n) {
        dst[i] = src[i];
        i++;
                        strncpy is included in C std library.
                         Note: if dst size is too small,
                        it may not be null-terminated
int main() {
   char s[3] = \{'h', 'i', '\setminus 0'\};
   char h[2];
   strncpy(h, s, 2);
   h[0] = 'H';
   printf("s=%s h=%s\n",s,h);
}
```

A different way of initializing string

• • •

A different way of initializing string

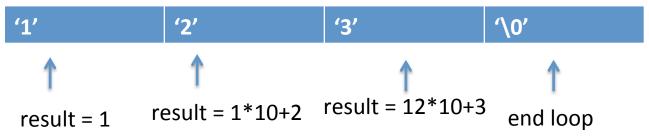

```
char s1[3] = {'h', 'i', '\setminus 0'};
                                            0x00
//equivalent to
//char s1[3] = "hi";
                                             'h'
                                     s1:
                                                  0xdeadbefef12345678
char *s2 = "bye";
s1[0] = 'H';
                                            0x00
s2[0] = 'B';
printf("s1=%s s2=%s\n",s1,s2);
                                     s2:
                                            0x21
                                            0x00
                                             'e'
                             read-only
                             memory
                                                   0x0000000087654321
```

The Atoi function

```
// atoi returns the integer
// corresponding to the string of digits
int atoi(char *s)
int main()
   char *s= "123";
   printf("integer is %d\n", atoi(s));
```

The Atoi function

```
// atoi returns the integer
// corresponding to the string of digits
int atoi(char *s) {
  int result = 0;
  int i = 0;
  while (s[i] \ge 0' \&\& s[i] \le 9') {
           result = result * 10 + (s[i] - '0');
           i++;
   return result;
```

Array of pointers

```
char* names[3] = {
   "alice",
   "bob",
                           3*8 bytes
   "clark"
};
                              names:
char **namep;
namep = names;
                                        "clark"
printf("name is %s", namep[1]);
                                        "bob"
                                         "alice"
```

The most commonly used array of pointers: argv

```
int main(int argc, char **argv)
{
    for (int i = 0; i < argc; i++) {
        printf("%s\n", argv[i]);
    }
}
$ ./a.out 1 2 3
./a.out 1 2 3</pre>
```

argv[0] is the name of the executable

Structs

Struct stores fields of different types contiguously in memory

C has no class/object.

Struct is like a class without associated methods

Struct

 Array: a block of n consecutive elements of the same type.

 Struct: a collection of elements of diffferent types.

Structure

```
struct student {
   int id;
   char *name;
};
```

Fields of a struct are allocated next to each other, but there may be gaps (padding) between them.

Structure

Structure

Typedef

```
typedef struct {
   int id;
   char *name;
} student;
```

Pointer to struct

```
typedef struct {
   int id;
   char *name;
} student;

student t = {1024, "alice"};
student *p = &t;

p->id = 1023;
p->name = "bob";
printf("%d %s\n", t.id, t.name);
```

Mallocs

Allocates a chunk of memory dynamically

Recall memory allocation for global and local variables

- Global variables are allocated space before program execution.
- Local variables are allocated when entering a function and de-allocated upon its exit.

Malloc

Allocate space dynamically and flexibly:

- malloc: allocate storage of a given size
- free: de-allocate previously malloc-ed storage

```
void *malloc(size_t size);
```

A void pointer is a pointer that has no associated data type with it. A void pointer can hold address of any type and can be casted to any type.

```
void free(void *ptr);
```

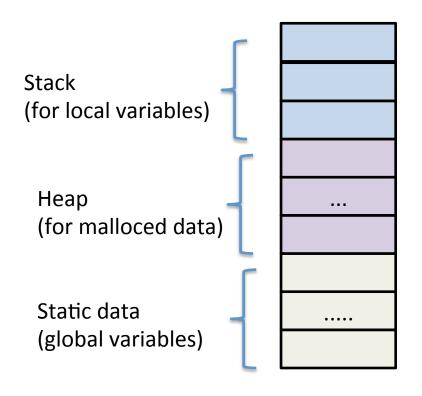

Malloc

```
#include <stdlib.h>

int *newArray(int n) {
   int *p;
   p = (int*)malloc(sizeof(int) * n);
   return p;
}
```

Conceptual view of a C program's memory at runtime

 Separate memory regions for global, local, and malloc-ed.

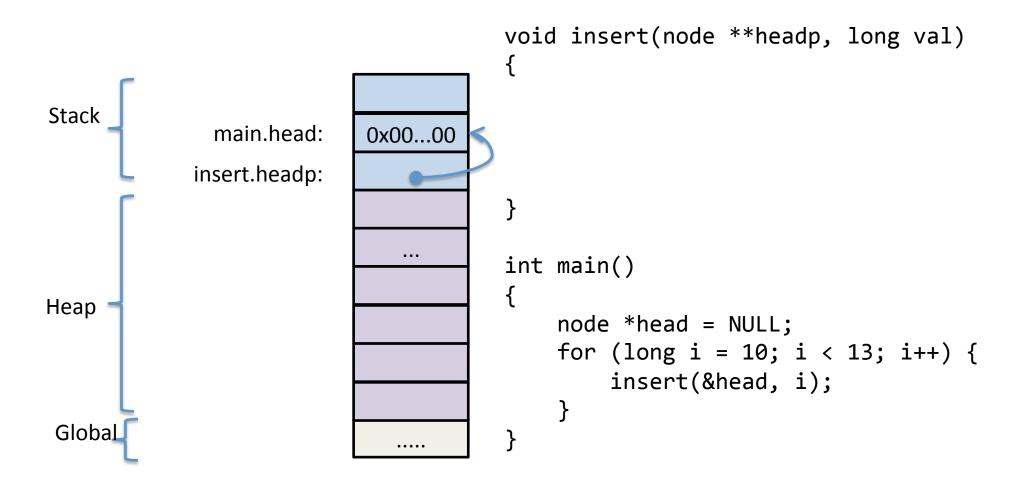

We will refine this simple view in later lectures

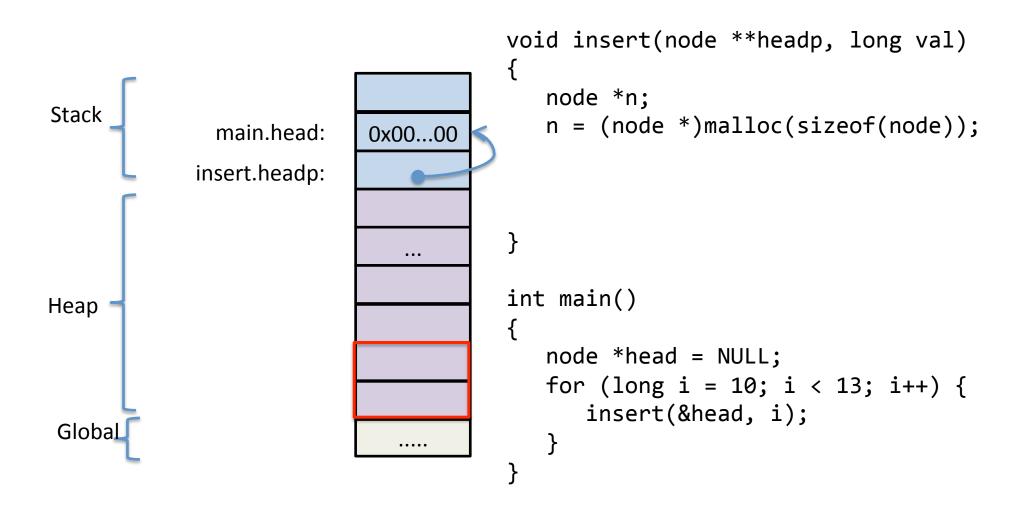

Linked list in C: insertion

```
typedef struct {
     long val;
     struct node *next;
 }node;
// insert val into linked list to the head of the linked
// list and return the new head of the list in *headp
void
insert(node **headp, long val) {
}
int main() {
    node *head = NULL;
    for (long i = 10; i < 13; i++)
       insert(&head, i);
}
```

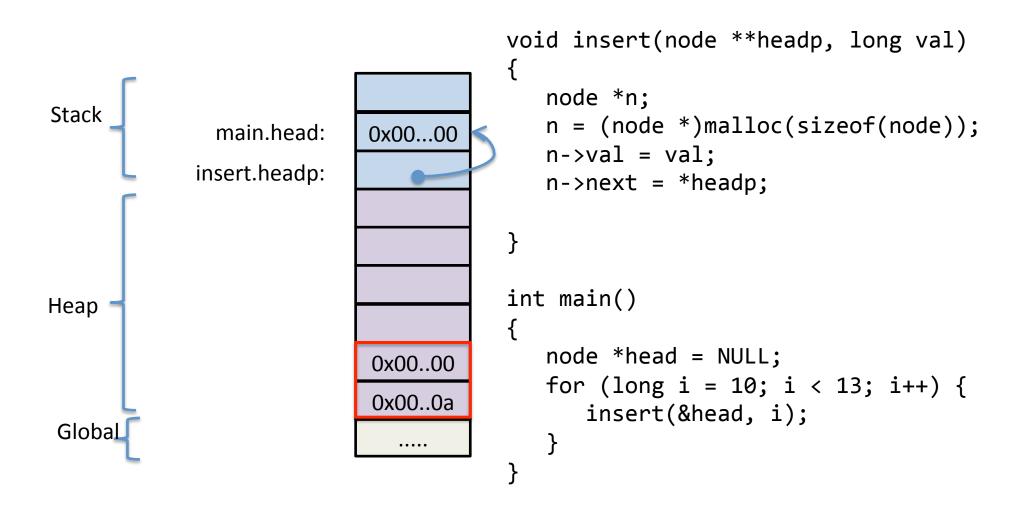

Inserting into a linked list

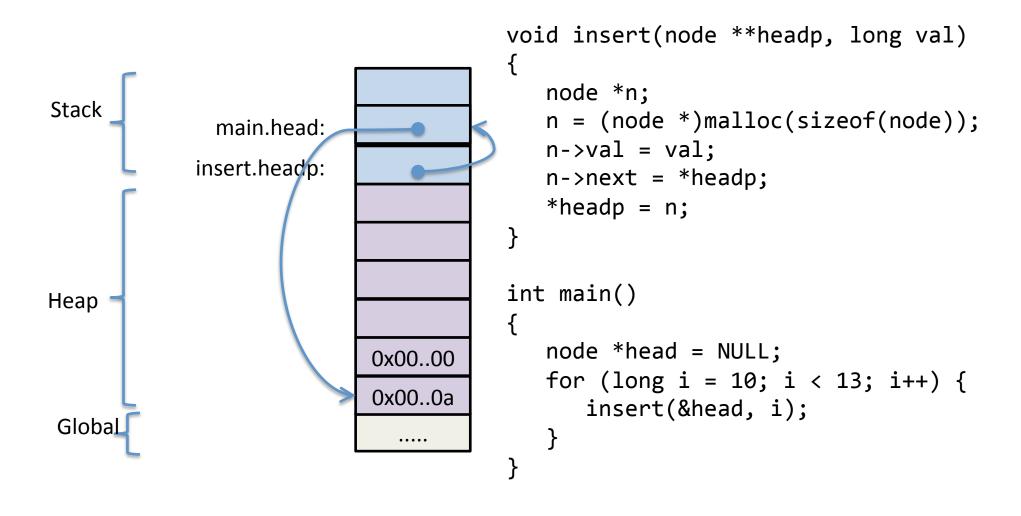

1st insert call

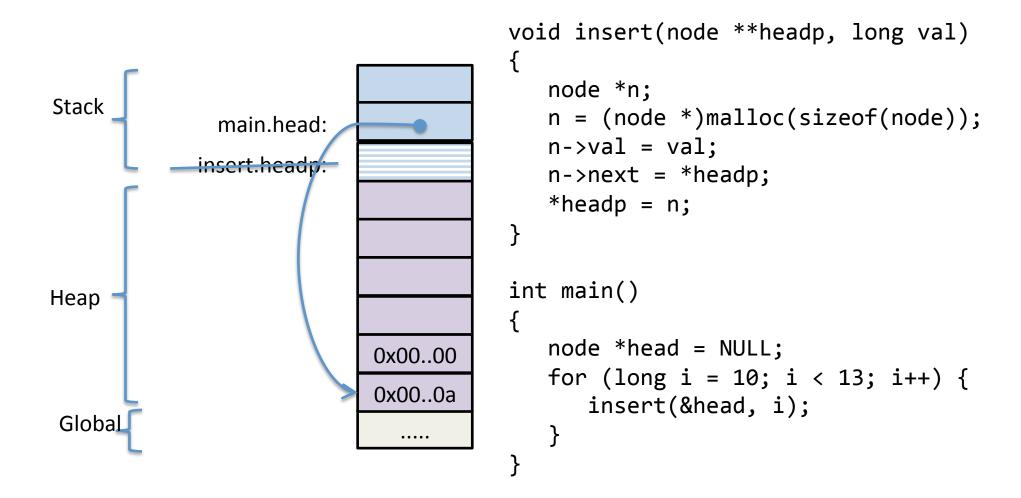

1st insert call

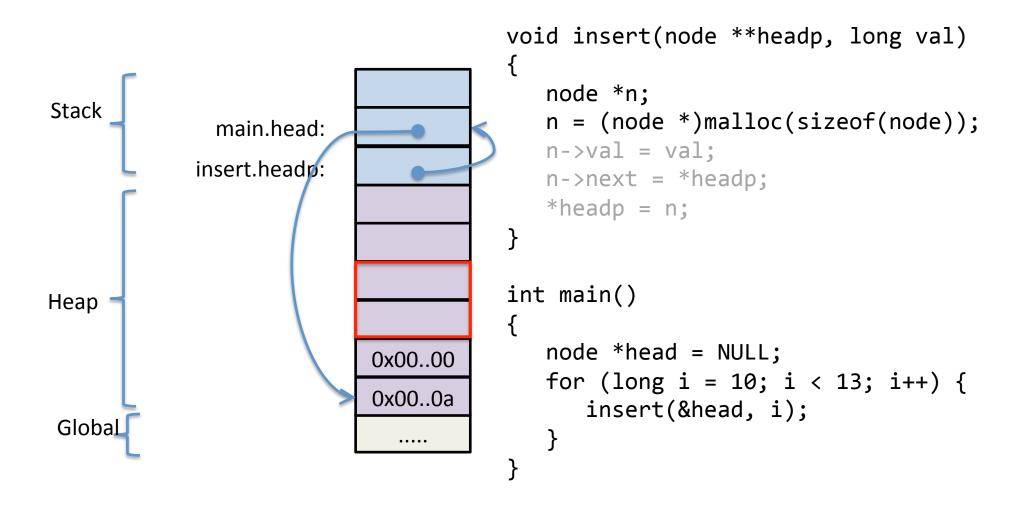

1st insert call

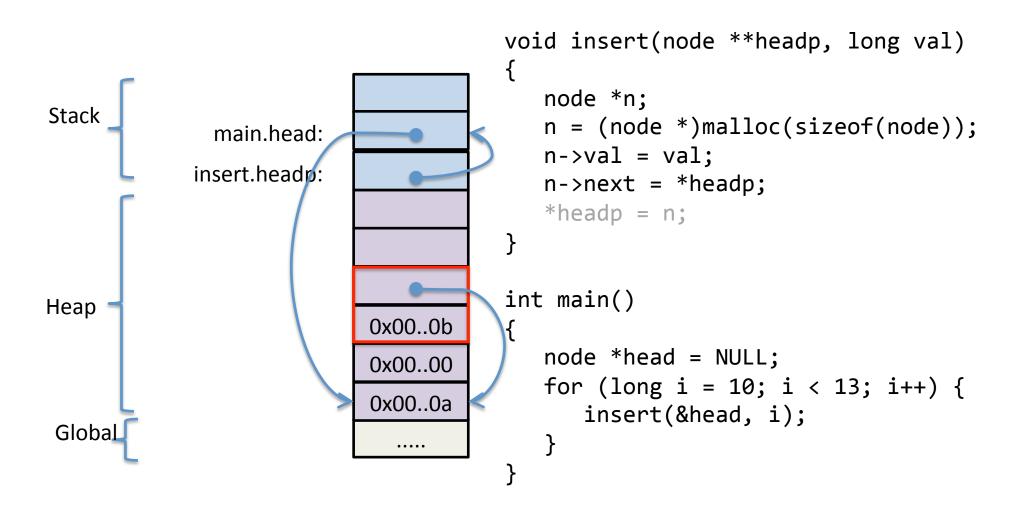

after 1st insert call

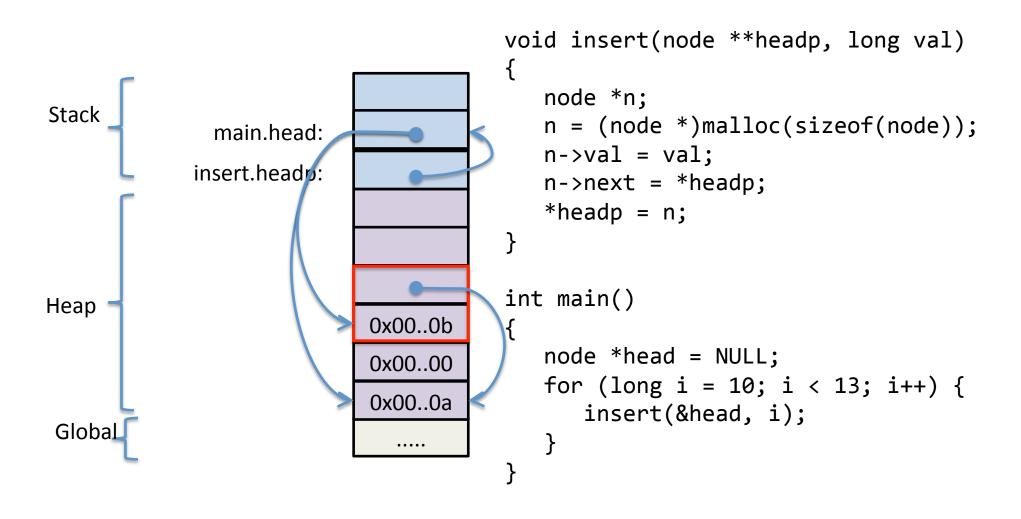

2nd insert call

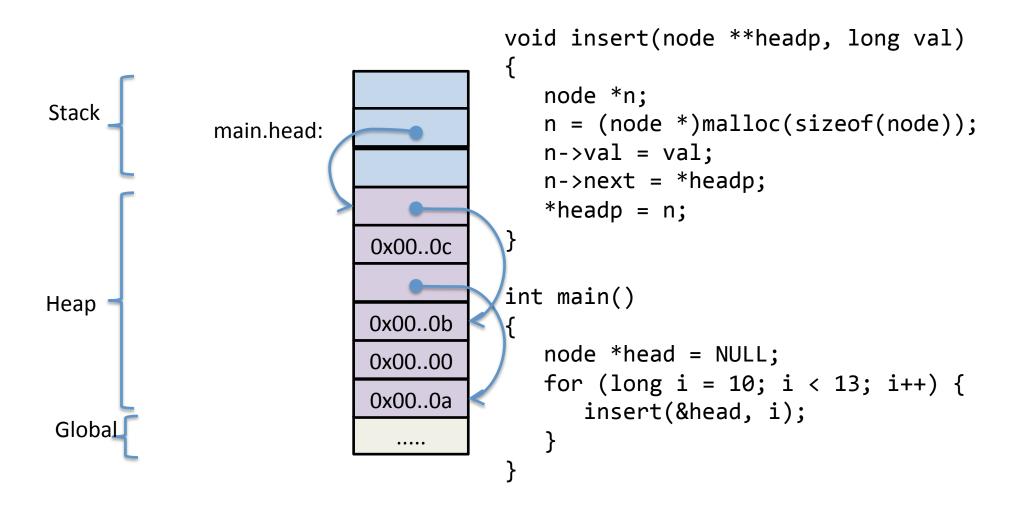

2nd insert call

2nd insert call

after 3rd call

2D Arrray

2D arrays are stored contiguously in memory in row-major format

Declare a k dimensional array

int $arr[n_1][n_2][n_3]...[n_{k-1}][n_k]$

n_i is the length of the ith dimension

Declare a k dimensional array

int $arr[n_1][n_2][n_3]...[n_{k-1}][n_k]$

n_i is the length of the ith dimension

Example: 2D array

int matrix[2][3]

Declare a k dimensional array

int
$$arr[n_1][n_2][n_3]...[n_{k-1}][n_k]$$

n_i is the length of the ith dimension

Example: 2D array

int matrix[2][3]

	Col 0	Col 1	Col 2
Row 0			
Row 1			

Declare a k dimensional array

int
$$arr[n_1][n_2][n_3]...[n_{k-1}][n_k]$$

n_i is the length of the ith dimension

Example: 2D array

int matrix[2][3] =
$$\{\{1, 2, 3\}, \{4, 5, 6\}\};$$

	Col 0	Col 1	Col 2
Row 0	1	2	3
Row 1	4	5	6

Declare a k dimensional array

int
$$arr[n_1][n_2][n_3]...[n_{k-1}][n_k]$$

n_i is the length of the ith dimension

Example: 2D array

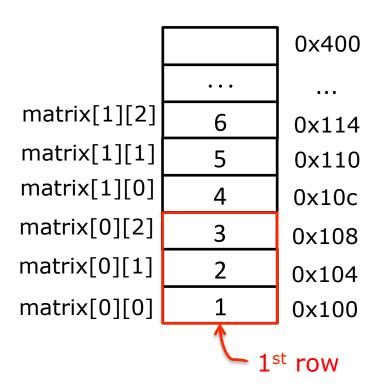

int matrix[2][3] =
$$\{\{1, 2, 3\}, \{4, 5, 6\}\};$$

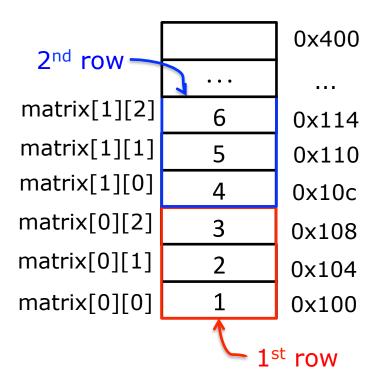

Access an element at second row and third column

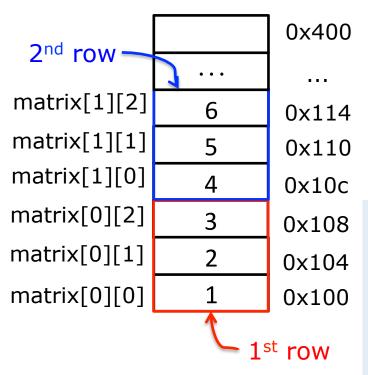

$$matrix[1][2] = 10$$

```
int matrix[2][3] = {{1, 2, 3}, {4, 5, 6}};
for (int i = 0; i < 2; i++) {
    for (int j = 0; j < 3; j++) {
        printf("%p\n",&matrix[i][j]);
    }
}</pre>
```

		0x400
	• • •	
matrix[1][2]	6	0x114
matrix[1][1]	5	0x110
matrix[1][0]	4	0x10c
matrix[0][2]	3	0x108
matrix[0][1]	2	0x104
matrix[0][0]	1	0x100

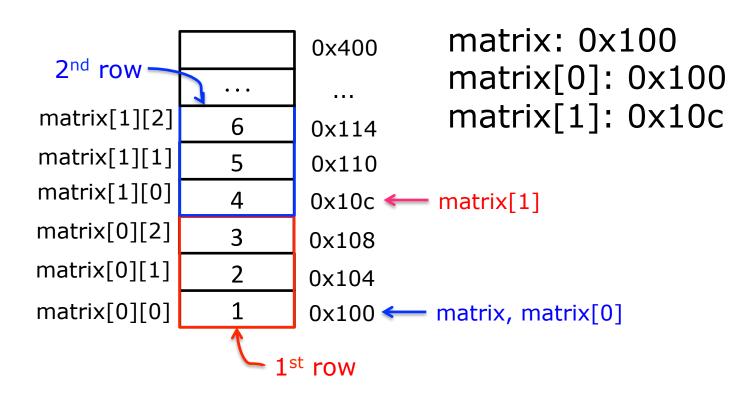

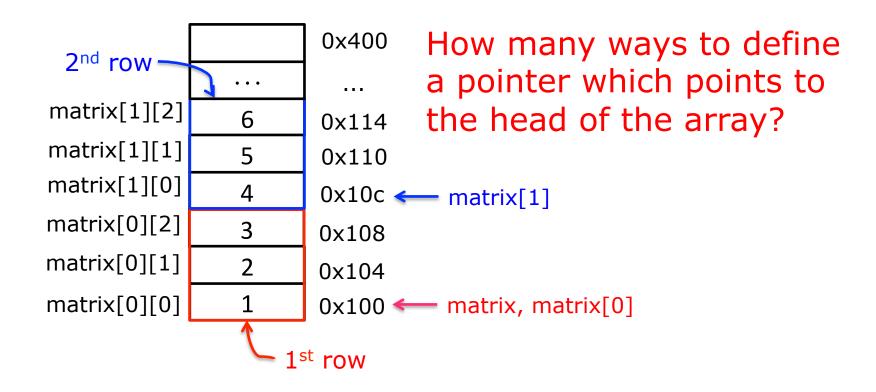

What are the values of matrix, matrix[0] and matrix[1]?

```
int *p1, *p2, *p3;
p1 = (int *)matrix;
p2 = matrix[0];
p3 = matrix[1];

printf("matrix:%p matrix[0]:%p\
matrix[1]:%p\n", p1, p2, p3);
```

```
0x400
                                      int *p = \text{Amatrix}[0][0];
 2<sup>nd</sup> row
                                      int *p = matrix[0];
matrix[1][2]

                     1<sup>st</sup> row
                            matrix[1][0]: *(p + 3)
```

p[3]

A general question

Given a 2D array matrix[m][n] and a pointer p which points to matrix[0][0], how to use p to access matrix[i][j]?

A general question

```
Given a 2D array matrix[m][n] and a pointer p which points to matrix[0][0], how to use p to access matrix[i][j]? address of matrix[i][j]: p + i * n + j
```

Accessing 2D array using pointer

```
int matrix[2][3] = \{\{1, 2, 3\}, \{4, 5, 6\}\};
```

```
for (int i = 0; i < 2; i++) {
   for (int j = 0; j < 3; j++) {
     printf("%d\n", matrix[i][j]);
   }
}</pre>
```

OR

```
int *p = matrix[0]; // or int *p = (int *)matrix;
for (int i = 0; i < 2*3; i++) {
    printf("%d\n", p[i]);
}</pre>
```
